

ES-22 Remove Transmission/Distribution System Limitations and Other Infrastructure Barriers for Renewables and Other Clean Distributed Generation

Assessment: High Priority. Bin B. 16 out of 22 votes.

This is extremely important, especially for the development of clean energy. Improving the regulatory process for siting and permitting of new transmission lines and smart grid development (defined as an enhanced electric transmission or distribution network that provides smart metering, distributed generation management, and demand response, among other benefits) is critical to support the development of renewable energy, in that transmission and effective metering policies/technologies must be in place to move all energy to market.
